

FarmStack

Tally Sync — Computer Setup Guide

How to connect this computer's TallyPrime to FarmStack, one time.
After this setup, it keeps working on its own — nothing to do daily.

How it works (in one line)

Tailscale is a small free program that lets FarmStack on the internet reach the Tally running on this computer — safely, with a fixed address that never changes. You set it up once.

■ **One-time setup: about 15 minutes**

What you need before starting

- This computer (the one that has **TallyPrime** installed).
- An internet connection.
- Your FarmStack login (the website address).
- A Tailscale account — free. You can make one with Google or email.

Step 1 — Install Tailscale

Open a web browser and go to:

```
tailscale.com/download/windows
```

Click **Download**, then run the installer (Next → Install → Finish). When it finishes, a small Tailscale icon appears near the clock (bottom-right).

[Screenshot]

▲ The Tailscale download page — click the Download button.

Step 2 — Sign in and connect

Open **PowerShell** (Start menu → type *PowerShell* → Enter) and type:

```
tailscale up
```

A browser window opens — sign in (Google / email) and click **Connect / Approve**. When done, the Tailscale icon shows **Connected**.

[Screenshot]

▲ Browser sign-in / approve screen, then the 'Connected' state.

Step 3 — Turn on the secure link (Funnel)

Still in PowerShell, type:

```
tailscale funnel --bg 9000
```

The first time, it may say “*Funnel is not enabled*” and show a link. Open that link in the browser, click to enable Funnel, then run the command **again**.

When it works you'll see **Success** and a web address ending in **.ts.net**, like:

```
https://this-pc.tailXXXX.ts.net/
```

✓ **TIP** Write down / copy that **.ts.net** address. You'll paste it into FarmStack in Step 5. It belongs to *this* computer and never changes.

[Screenshot]

▲ PowerShell showing 'Success' and the `https://....ts.net` address.

Step 4 — Switch on Tally's connection

In **TallyPrime**, the built-in server must be ON so FarmStack can talk to it:

- Open TallyPrime → press **F1** → **Settings** → **Connectivity**.
- Set “**TallyPrime acts as Server**” to **Yes**, with **Port 9000**.
- Save.

■ **NOTE** Quick check: open `http://localhost:9000` in a browser on this PC. If Tally's server is on, you'll get a response instead of an error.

[Screenshot]

▲ Tally Connectivity settings — 'acts as Server: Yes', Port 9000.

Step 5 — Tell FarmStack the address

- On **this** computer, open the **FarmStack** website in the browser the client will use every day.

- Go to the **Tally Sync** page.
- Paste the **https://....ts.net** address from Step 3 into the Tally server URL box.
- Click **Save**, then **Check / Test connection** — it should say connected.

■ **IMPORTANT** The address is saved **inside that browser**. If the client uses a different browser or computer for FarmStack, set the same address there too.

[Screenshot]

▲ *FarmStack → Tally Sync page with the address pasted and 'Connected'.*

One last setting — do not skip this

By default Tailscale logs out after about 6 months, which would quietly stop syncing. Turn that off so it stays connected forever:

- On any browser, go to **login.tailscale.com/admin/machines**.
- Find this computer in the list → click the ... **(three dots)** menu.
- Choose **Disable key expiry**.

■ **IMPORTANT** If you skip this, sync will silently break in a few months and need a re-login.

[Screenshot]

▲ Admin → Machines → ■ menu → 'Disable key expiry'.

That's it — what happens day to day

- Turn on the computer → Tailscale starts by itself.
- Open **TallyPrime** and keep it running while working.
- Use FarmStack normally. Sales and purchases sync to Tally automatically — the status turns to **Synced** on its own.

✓ **TIP** If Tally is closed or the PC is off when an invoice is made, it simply waits as **Failed** and **pushes itself automatically** the next time Tally is open and online. Nothing is ever lost.

If something doesn't work

Problem	What to do
Status stays Failed	Make sure TallyPrime is open and its server is on (Step 4). It retries on its own.
'tailscale' is not recognized	Close and reopen PowerShell, or run it as: "C:\Program Files\Tailscale\tailscale.exe" funnel --bg 9000
'Tailscale is stopped'	Run <code>tailscale up</code> first, then the funnel command again.
Test connection fails in FarmStack	Re-check the .ts.net address is pasted exactly, Tally is open, and <code>http://localhost:9000</code> responds on this PC.
Need to turn the link off	<code>tailscale funnel --https=443 off</code>

Setup checklist

- Tailscale installed
- Signed in & Connected (tailscale up)
- Funnel running — got the `https://....ts.net` address
- Tally server ON (Port 9000)
- Address pasted into FarmStack → Tally Sync, test = connected
- Key expiry disabled in the admin page
